

MapStore

MapStore is an Open Source web mapping framework that allows an organisation to create, manage and share maps from a variety of data sources.

MapStore aims to be both a product as well as a web GIS framework. It is a product that can be used with no coding to cover the use case of a standard geoportal, however it is also a framework that can be used as a starting point to build sophisticated geospatial applications.

Maps and mashups can be made blending content served from servers like Google Maps, OpenStreetMap, Bing or from any server adhering to OGC standards like WFS, CSW, WMS, WMTS and TMS.

MapStore is maintained by geosolutions-it.
